FREEZE PROBABILITIES

KENTUCKY FREEZE RISK: As cooler mornings and shorter daylight hours signal the rapidly approaching end of the growing season; agriculturalists begin to ponder the likelihood of an early frost and possible freeze damage to late maturing crops. This year, early planting and timely rains have pushed Kentucky crops to early maturity. Many crops are already harvested, leaving only late planted double crop soybeans and tobacco vulnerable to an early freeze.

The freeze probability table on the following page shows earliest freezes usually occur the latter part of September or the first week in October; however, freezing temperatures have been recorded as early as September 7 at Eastern Division cities. In most of Kentucky the probability rises to 50 percent chance of 32E or lower temperatures between October 15 and October 25. The freeze data in the table are based on temperatures in a standard U.S. National Weather Service thermometer shelter at a height of approximately 5 feet above the ground and/or in local areas subject to air drainage. These data are based on 1961-90 data. The freeze probability dates in the map shown below are 30-year averages from 1961 thru 1990.
